## Q&A

Questions and answers

# SafeGuard Hub

Our application is intended to provide as a second opinion on urgent ultrasound study for inexperienced practitioners.

01

# Business Module

Talking about the business model of  
our application

# Customer needs

- Let AI provide a second opinion on urgent ultrasound study for inexperienced practitioners
- Learn how to analyze ultrasound images

# Persona

## Doctor

- Wants to have a reliable way to strengthen his decision on the diagnosis
- Wants a platform where he can share the results with other medical practitioners

## Medical student

- Is worried that there aren't enough trustworthy resources available for learning about specialized techniques.
- Can automatically share his diagnosis with another doctor for a quick review

# Prototype

## Customer needs we've resolved

With the help of our application, our clients may now obtain a second opinion on specialist procedures increasing their confidence in accurately diagnosing patients.

# Market opportunities

- Distributing our app to healthcare facilities over a subscription.
- Installing our AI models into specialized hardware
- Collaboration with medical universities for learning purposes

# Business model

## **Concurrent solutions:**

It appears that there isn't a platform available for using an AI model to detect pneumothorax.

Regarding the AI model, there appear to be distinct trained models: one model appears to have true negative and true positive rates of 75% and 84%, respectively, whilst our model appears to have an accuracy rate of about 90%.

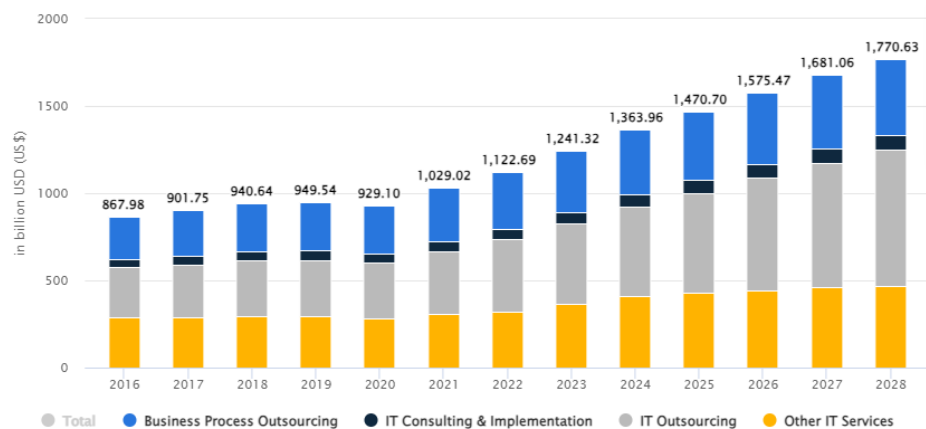

## **Value proposition:**

Harness the power of AI to bridge knowledge gaps for young practitioners. SafeGuard Hub provides expert opinions, guiding users to make confident diagnostic decisions.

## **Possible clients:**

- Doctors, Medical staff
- University students

There is a lot of space for growth on our platform because the IT sector expanded by 6.15% YoY and the AI field is booming.

“Artificial intelligence is not a substitute for human intelligence; it is a tool to amplify human creativity and ingenuity.”

— Fei-Fei Li, Co-Director of the Stanford Institute for Human-Centered Artificial Intelligence

02

# Technical Module

Talking about the technical  
aspects

# Application

Our application has 3 big parts, Back-end, Front-end and AI.

The Back-end is a .NET web api , that has a documentation deployed on localhost.

The Front-end is a react web application.

The AI is a FastAPI python project.

# Innovative component

The main innovative component that we have  
in our application is the AI model

# Self-made components

Our AI model is self-made and trained:

For the model we started with MobileNet, a dedicated convolutional network model for image classification:

The size of the model allows its use in low-power hardware contexts

The model architecture does not compromise performance

# AI results

The primary challenge we faced during the AI creation process was the limited quantity of data available to us—roughly 300 print screens.

However, we achieved a 90% accuracy rate and incredibly fast response times (<25 ms).

# 03

# Demo

Demo of the application

# Future work

Ai:

- Exploring the pre-trained models for this problem in more detail
- Implementation of an attention mechanism for image processing
- Evaluation of these models on larger sets of images (as possible).
- Extending the capabilities of ultrasound video processing
- Expanding capabilities to match multiple images to a subject

# Future work

Hub:

- Adding more models
- Sending reports automatically to email
- Implementing app on hardware

# Our team
